Lymphoma; Vision Loss; Sinonasal Tumor; Multiple Cranial Nerves; Intracranial Neoplasms

This is a brief report on a case of lymphoma in a 63-year-old man with no systemic illnesses, who presented with sudden onset painful defective vision of the right eye associated with drooping of the upper lid of one-week duration.

Multiple cranial nerves (II, pupil involving III, IV, and VI) were affected. Coronal and axial T2-weighted magnetic resonance imaging (MRI) showed a large sinonasal mass lesion with bony destruction and orbital and intracranial extension suggesting lymphoma that was confirmed on histopathological examination (Figure 1).

Conflict of Interests
The authors declare no conflict of interest in this study.

Acknowledgments
None.
